

This device is made available to clean down your wagon's chute; designed to ensure your safety, protect the local environment, comply with legislation and site-specific requirements. We hope you find it both simple and effective.

- BlueRinse washwater continuously recycles through the unit, maintaining a safe pH to avoid skin irritations and burns – please do not use your own water supply as this may overwhelm the system.
- It is meant for Chute wash-down only – do not use it to clean out your Wagon's Drum.

Guide:

1. Position vehicle in Washout Area, to the rear of the unit

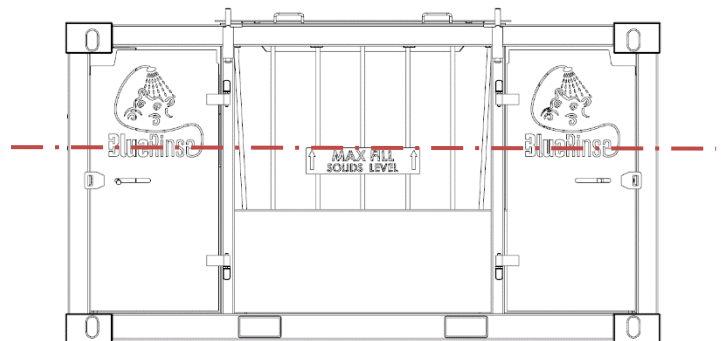

2. Lower chute in order to direct washwater into the sack.

3. Verify power lead is connected. Turn on the device and check both pumps are also switched on.

4. Check solids waste in sack does not exceed the 'Max Fill' level. Speak with site supervisor if it does. This is important as it is the **Safe Working Load** and the recommended level for safe pH reduction.

5. Operate the valve on BlueRinse washdown hose to clean your chute. The water will drain through the BlueRinse Nappy Sack which will reduce the pH as the water runs through it. Water is recycled back into the tank keeping you safe and ready for the next washdown.

When finished please take a moment to wash off black deflector on top, then close the valve and replace the hose.

**If in doubt please ask site supervisor.
Thank you for your cooperation.**
